## **DETAILED ACTION**

### ***Claim Rejections - 35 USC § 112***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 6-12 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 6-12 are improperly dependent on multiple dependent claims.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1- are rejected under 35 U.S.C. 103(a) as being unpatentable over Lehmann in view of Refson.

The patent by Lehmann (6,164,248) shows a control valve comprising a body (1) which is equipped with a fluid inlet (7) and with at least two fluid outlets (10,11,12) and which delimits a housing of revolution for an adjusting element (3) able to rotate about an axis of rotation and to adopt various angular positions to control the distribution of fluid through the outlets. The body comprises an end wall (6) into which the fluid inlet opens and a side wall (2) into which the fluid outlets open.

Art Unit: 3747

The adjusting member taught by Lehmann does not specify the sealing method used in the valve. The patent by Refson (GB 934,531) shows a coolant valve surrounded by a sealing ring (15) in the form of an open annulus, which rotates as one with the adjusting member and is arranged with a small clearance around the adjusting member. This allows the sealing ring to be pressed firmly internally against the side wall with a view to ensuring sealing under the action of the pressure of the fluid.

With respect to claim 2, it is the view of the examiner that any surface used in the valve would be made of a material with a low coefficient of friction.

The patent by Refson further shows that the sealing ring comprises a smooth exterior surface into which a multitude of uniformly spaced blind holes open.

It is the view of the examiner that the specific design of the contours is an obvious choice of design.
